MICROSOFT SENTINEL

Security Monitoring Use Case Report

Use Case Name	Brute Force Attack Detection with Microsoft Sentinel
Use Case ID	UC-001
Prepared By	G Rama Krishina
Date	31-08-2026

1. Objective

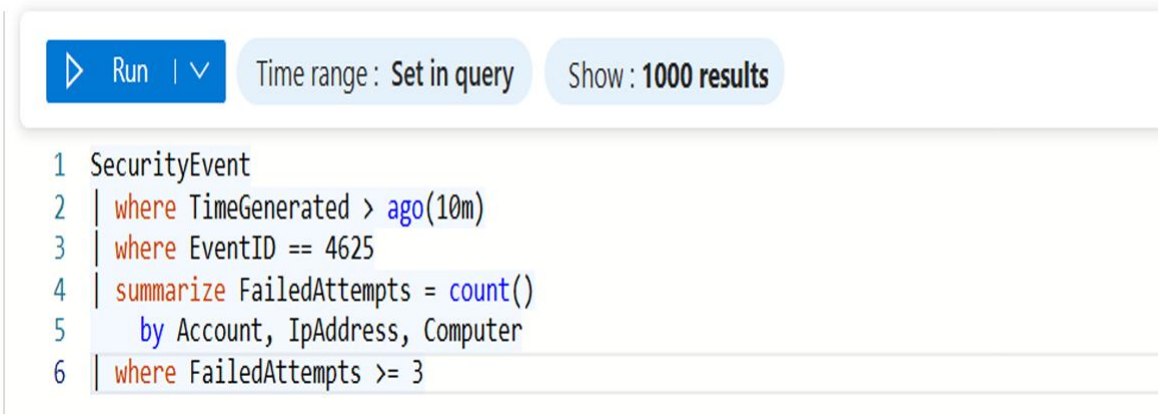

The objective of this use case is to detect and identify suspicious activities using Microsoft Sentinel analytics rules. It helps the security team generate alerts based on predefined detection conditions and investigate potential security threats. The use case improves threat visibility, enables faster incident response, and supports proactive security monitoring.

2. Steps for Creating the Rule

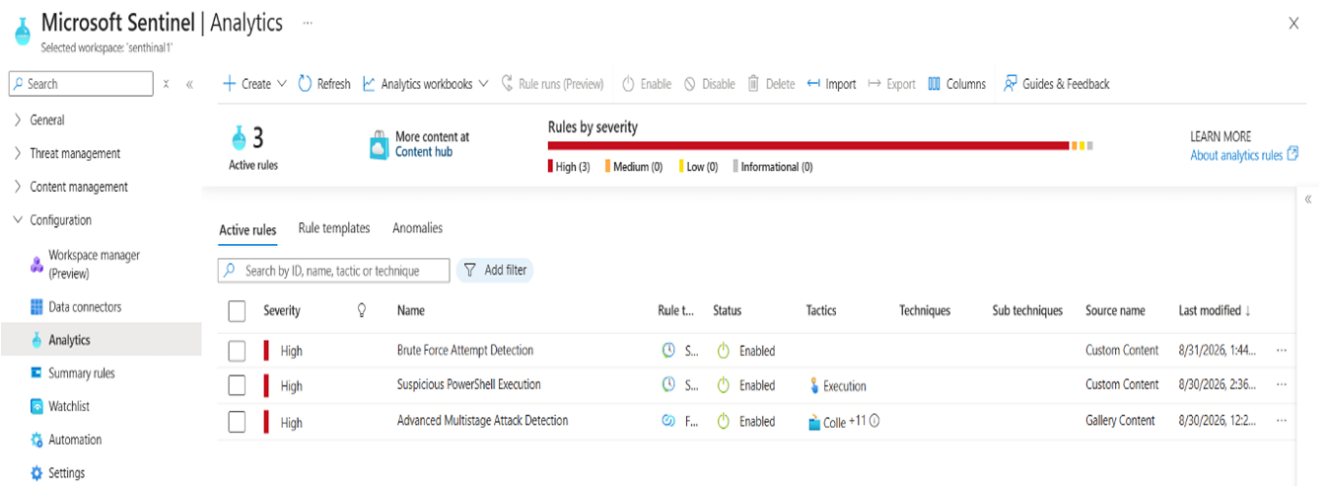

Step 1: Open Virtual Machine

Step 2: Open Sentinel and in log section execute the KQL query

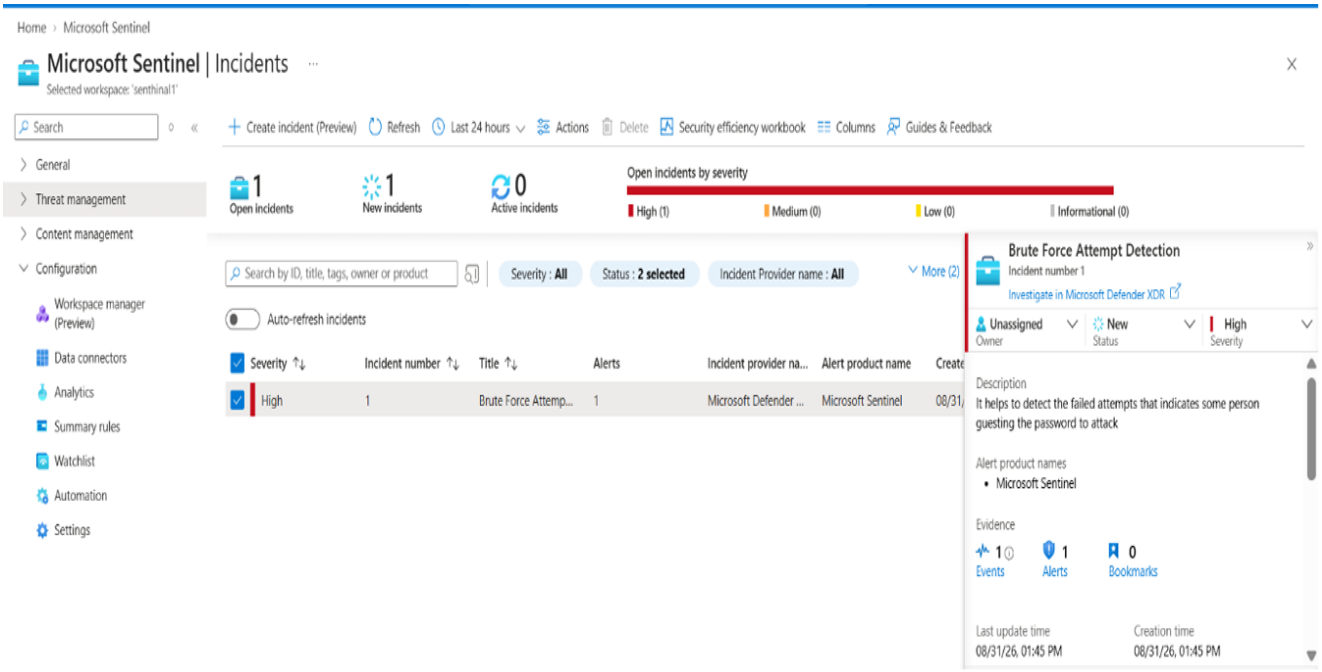

Step 3: Create an analytics rule for configuring a logic with the information

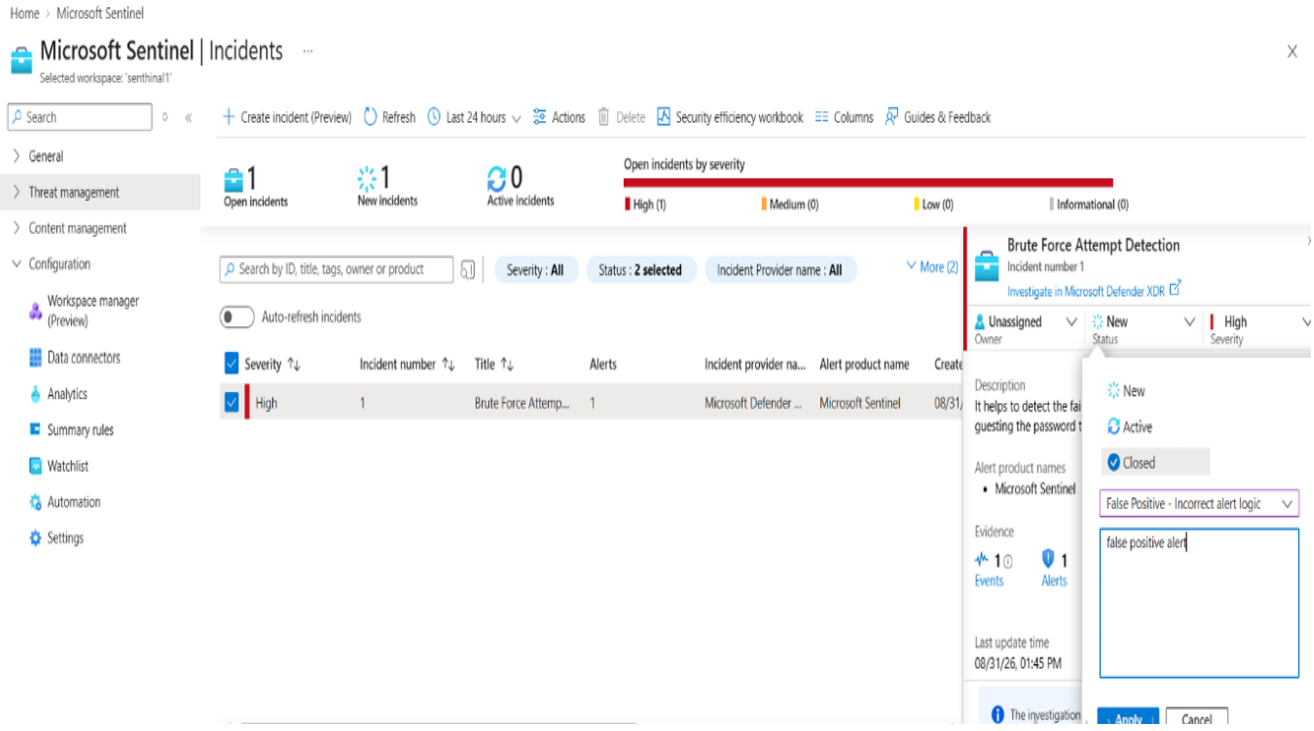

Successfully created the Brute force Detection Rule.

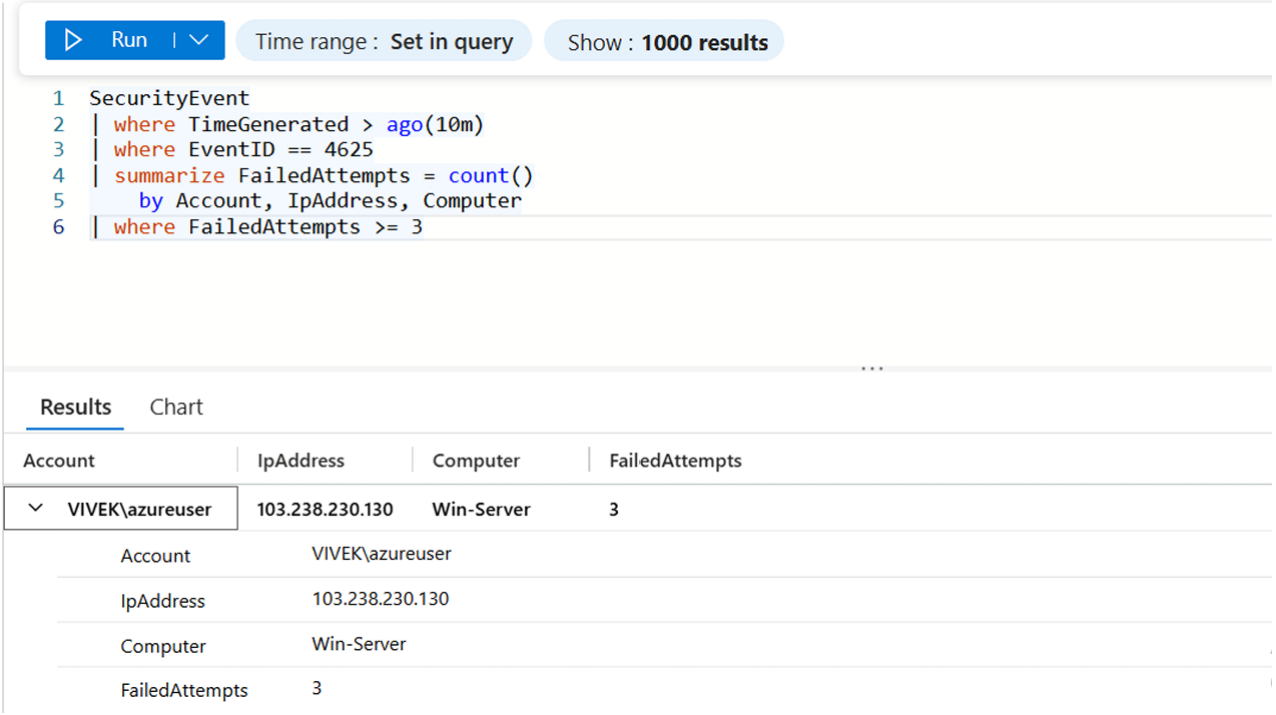

Step 4: Repeat brute force attack in the incident section and analyze the IP Address, Account, Failed Attempts.

Step 5: Update the Status from new to closed with closure classification and apply and close the incident.

3. Final Output

4. Outcomes

The use case successfully detects suspicious activities by applying predefined detection logic through Microsoft Sentinel analytics rules. The generated alerts and incidents provide security teams with the required information to investigate and validate potential threats. This improves threat detection, reduces response time, and strengthens the organization's overall security monitoring capability.
